

A63L7332 Series

Preliminary

128K X 32 Bit Synchronous High Speed SRAM with Burst Counter and Pipelined Data Output

Document Title

128K X 32 Bit Synchronous High Speed SRAM with Burst Counter and Pipelined Data Output

Revision History

<u>Rev. No.</u>	<u>History</u>	<u>Issue Date</u>	<u>Remark</u>
0.0	Initial issue	June 02, 1998	Preliminary
1.0	Change fast access times from 4.5/5 ns to 4.2/4.5/5.0 ns	August 27, 1998	
1.1	Change DC and operating characteristics - I _{CC1} (Max.) : 300mA to 350mA I _{SB1} (Max.) : 25mA to 38mA	December 18, 1998	
1.2	Modify 100-pin LQFP symbol y dimensions - Max. in mm :0.08 → 0.1 Max. in inches : 0.003 → 0.004	December 31, 1998	

A63L7332 Series

Preliminary

128K X 32 Bit Synchronous High Speed SRAM with Burst Counter and Pipelined Data Output

Features

- Fast access times: 4.2/4.5/5.0 ns (143/133/100 MHz)
- Single +3.3V+10% or +3.3V-5% power supply
- Synchronous burst function
- Individual Byte Write control and Global Write
- Registered output for pipelined applications
- Three separate chip enables allow wide range of options for CE control, address pipelining
- Selectable BURST mode
- SLEEP mode (ZZ pin) provided
- Available in 100-pin LQFP package

General Description

The A63L7332 is a high-speed, low-power SRAM containing 4,194,304 bits of bit synchronous memory, organized as 131,072 words by 32 bits.

The A63L7332 combines advanced synchronous peripheral circuitry, 2-bit burst control, input registers, output registers and a 128K X 32 SRAM core to provide a wide range of data RAM applications.

The positive edge triggered single clock input (CLK) controls all synchronous inputs passing through the registers. Synchronous inputs include all addresses (A0 - A16), all data inputs (I/O₁ - I/O₃₂), active LOW chip enable (\overline{CE}), two additional chip enables (CE2, $\overline{CE2}$), burst control inputs (\overline{ADSC} , \overline{ADSP} , \overline{ADV}), byte write enables (\overline{BWE} , $\overline{BW1}$, $\overline{BW2}$, $\overline{BW3}$, $\overline{BW4}$) and Global Write (\overline{GW}). Asynchronous inputs include output enable (\overline{OE}), clock (CLK), BURST mode (MODE) and SLEEP mode (ZZ).

Burst operations can be initiated with either the address status processor (\overline{ADSP}) or address status controller (\overline{ADSC}) input pin. Subsequent burst sequence burst addresses can be internally generated by the A63L7332 and controlled by the burst advance (\overline{ADV}) pin. Write cycles are internally self-timed and synchronous with the rising edge of the clock (CLK).

This feature simplifies the write interface. Individual Byte enables allow individual bytes to be written. $\overline{BW1}$ controls I/O₁ - I/O₈, $\overline{BW2}$ controls I/O₉ - I/O₁₆, $\overline{BW3}$ controls I/O₁₇ - I/O₂₄, and $\overline{BW4}$ controls I/O₂₅ - I/O₃₂, all on the condition that \overline{BWE} is LOW. \overline{GW} LOW causes all bytes to be written.

Block Diagram

Pin Description

Pin No.	Symbol	Description
32 - 37, 44 - 50, 81, 82, 99, 100	A0 - A16	Address Inputs
89	CLK	Clock
87, 93 - 96	\overline{BWE} , $\overline{BW1}$ - $\overline{BW4}$	Byte Write Enables
88	\overline{GW}	Global Write
86	\overline{OE}	Output Enable
92, 97, 98	$\overline{CE2}$, $\overline{CE2}$, \overline{CE}	Chip Enables
83	\overline{ADV}	Burst Address Advance
84	\overline{ADSP}	Processor Address Status
85	\overline{ADSC}	Controller Address Status
31	MODE	Burst Mode: HIGH or NC (Interleaved burst) LOW (Linear burst)
64	ZZ	Asynchronous Power-Down (Snooze): HIGH (Sleep) LOW or NC (Wake up)
2, 3, 6 - 9, 12, 13, 18, 19, 22 - 25, 28, 29, 52, 53, 56 - 59, 62, 63, 68, 69, 72 - 75, 78, 79	I/O ₁ - I/O ₃₂	Data Inputs/Outputs
1, 14, 16, 30, 38, 39, 42, 43, 51, 66, 80	NC	No Connection
15, 41, 65, 91	VCC	Power Supply
17, 40, 67, 90	GND	Ground
4, 11, 20, 27, 54, 61, 70, 77	VCCQ	Isolated Output Buffer Supply
5, 10, 21, 26, 55, 60, 71, 76	GNDQ	Isolated Output Buffer Ground

Synchronous Truth Table (See Notes 1 Through 5)

Operation	Address Used	\overline{CE}	$\overline{CE2}$	CE2	\overline{ADSP}	\overline{ADSC}	\overline{ADV}	\overline{WRITE}	\overline{OE}	CLK	I/O Operation

WRITE Cycle, Suspend Burst	Current	H	X	X	X	H	H	L	X	L-H	Din

- Notes:
1. X = "Disregard", H = Logic High, L = Logic Low.
 2. $\overline{\text{WRITE}} = \text{L}$ means:
 - 1) Any $\overline{\text{BWx}}$ ($\overline{\text{BW1}}$, $\overline{\text{BW2}}$, $\overline{\text{BW3}}$, or $\overline{\text{BW4}}$) and $\overline{\text{BWE}}$ are low or
 - 2) $\overline{\text{GW}}$ is low.
 3. All inputs except $\overline{\text{OE}}$ must be synchronized with setup and hold times around the rising edge (L-H) of CLK.
 4. For write cycles that follow read cycles, $\overline{\text{OE}}$ must be HIGH before the input data request setup time and held HIGH throughout the input data hold time.
 5. $\overline{\text{ADSP}}$ LOW always initiates an internal Read at the L-H edge of CLK. A Write is performed by setting one or more byte write enable signals and $\overline{\text{BWE}}$ LOW or $\overline{\text{GW}}$ LOW for the subsequent L-H edge of CLK. Refer to the Write timing diagram for clarification.

Write Truth Table

Operation	$\overline{\text{GW}}$	$\overline{\text{BWE}}$	$\overline{\text{BW1}}$	$\overline{\text{BW2}}$	$\overline{\text{BW3}}$	$\overline{\text{BW4}}$
READ	H	H	X	X	X	X
READ	H	L	H	H	H	H
WRITE Byte 1	H	L	L	H	H	H
WRITE all bytes	H	L	L	L	L	L
WRITE all bytes	L	X	X	X	X	X

Linear Burst Address Table (MODE = LOW)

First Address (External)	Second Address (Internal)	Third Address (Internal)	Fourth Address (Internal)
X ... X00	X ... X01	X ... X10	X ... X11
X ... X01	X ... X10	X ... X11	X ... X00
X ... X10	X ... X11	X ... X00	X ... X01
X ... X11	X ... X00	X ... X01	X ... X10

Interleaved Burst Address Table (MODE = HIGH or NC)

First Address (External)	Second Address (Internal)	Third Address (Internal)	Fourth Address (Internal)
X ... X00	X ... X01	X ... X10	X ... X11
X ... X01	X ... X00	X ... X11	X ... X10

Absolute Maximum Ratings*

Power Supply Voltage (VCC) -0.5V to +4.6V
 Voltage Relative to GND for any Pin Except VCC (Vin, Vout) -0.5V to VCC +0.5V
 Power Dissipation (Pb) 2W
 Operating Temperature (Topr) 0°C to 70°C
 Storage Temperature (Tbias) -10°C to 85 °C
 Storage Temperature (Tstg) -55°C to 125°C

***Comments**

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

Recommended DC Operating Conditions

(0°C ≤ TA ≤ 70°C, VCC, VCCQ = 3.3V+10% or 3.3V-5%, unless otherwise noted)

Symbol	Parameter	Min.	Typ.	Max.	Unit	Note
VCC	Supply Voltage (Operating Voltage Range)	3.1	3.3	3.6	V	
VCCQ	Isolated Input Buffer Supply	3.1	3.3	VCC	V	
GND	Supply Voltage to GND	0.0	-	0.0	V	
VIH	Input High Voltage	2.0	-	VCC+0.3	V	1, 2
VIHQ	Input High Voltage (I/O Pins)	2.0	-	VCC+0.3	V	
VIL	Input Low Voltage	-0.3	-	0.8	V	1, 2

DC Electrical Characteristics

(0°C ≤ T_A ≤ 70°C, VCC, VCCQ = 3.3V+10% or 3.3V-5%, unless otherwise noted)

Symbol	Parameter	Min.	Max.	Unit	Test Conditions	Note
I _{LI}	Input Leakage Current	-	±2.0	μA	All inputs V _{IN} = GND to VCC	
I _{LO}	Output Leakage Current	-	±2.0	μA	$\overline{OE} = V_{IH}$, V _{out} = GND to VCC	
I _{CC1}	Supply Current	-	350	mA	Device selected; VCC = max. I _{out} = 0mA, all inputs = V _{IH} or V _{IL} Cycle time = t _{kc} min.	3, 11
I _{SB1}	Standby Current	-	38	mA	Device deselected; VCC = max. All inputs are fixed. All inputs ≥ VCC - 0.2V or ≤ GND + 0.2V Cycle time = t _{kc} min.	11
I _{SB2}		-	10	mA	ZZ ≥ VCC - 0.2V	
V _{OL}	Output Low Voltage	-	0.4	V	I _{OL} = 8 mA	
V _{OH}	Output High Voltage	2.4	-	V	I _{OH} = -4 mA	

Capacitance

Symbol	Parameter	Typ.	Max.	Unit	Conditions
C _{IN}	Input Capacitance	3	4	pF	T _A = 25°C; f = 1MHz VCC = 3.3V
C _{IO}	Input/Output Capacitance	4	5	pF	

* These parameters are sampled and not 100% tested.

AC Characteristics ($0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, $V_{CC} = 3.3\text{V} \pm 10\%$ or $3.3\text{V} \pm 5\%$)

Notes:

- All voltages refer to GND.
- Overshoot: $V_{IH} \leq +4.6V$ for $t \leq t_{kc}/2$.
Undershoot: $V_{IH} \geq -0.7V$ for $t \leq t_{kc}/2$.
Power-up: $V_{IH} \leq +3.6$ and $V_{CC} \leq 3.1V$
for $t \leq 200ms$
- I_{cc} is given with no output current. I_{cc} increases with greater output loading and faster cycle times.
- Test conditions assume the output loading shown in Figure 1, unless otherwise specified.
- For output loading, C_L = 5pF, as shown in Figure 2. Transition is measured $\pm 150mV$ from steady state voltage.
- At any given temperature and voltage condition, t_{kQH} is less than t_{kQL} and t_{oEH} is less than t_{oEL} .
- A WRITE cycle is defined by at least one Byte Write enable LOW and $\overline{\text{ADSP}}$ HIGH for the required setup and hold times. A READ cycle is defined by all byte write enables HIGH and ($\overline{\text{ADSC}}$ or $\overline{\text{ADV}}$ LOW) or $\overline{\text{ADSP}}$ LOW for the required setup and hold times.
- $\overline{\text{OE}}$ has no effect when a Byte Write enable is sampled LOW.
- This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK when either $\overline{\text{ADSP}}$ or $\overline{\text{ADSC}}$ is LOW and the chip is enabled. All other synchronous inputs must meet the setup and hold times with stable logic levels for all rising edges of clock (CLK) when the chip is enabled. Chip enable must be valid at each rising edge of CLK when either $\overline{\text{ADSP}}$ or $\overline{\text{ADSC}}$ is LOW to remain enabled.
- The load used for V_{OH}, V_{OL} testing is shown in Figure 2. AC load current is higher than the given DC values. AC I/O curves are available upon request.
- "Device Deselected" means device is in POWER-DOWN mode, as defined in the truth table. "Device Selected" means device is active (not in POWER-DOWN mode).
- MODE pin has an internal pulled-up, and ZZ pin has an internal pulled-down. All of them exhibit an input leakage current of 10 μ A.
- Snooze (ZZ) input is recommended that users plan for four clock cycles to go into SLEEP mode and four clocks to emerge from SLEEP mode to ensure no data is lost.

Timing Waveforms

Read Timing
Notes:

- *1. Q(A2) refers to output from address A2. Q(A2+1) refers to output from the internal burst address immediately following A2.
- *2. Timing for $\overline{CE2}$ and CE2 is identical to that for \overline{CE} . As shown in this diagram, when \overline{CE} is LOW, $\overline{CE2}$ is LOW and CE2 is HIGH. When \overline{CE} is HIGH, $\overline{CE2}$ is HIGH and CE2 is LOW.
- *3. Timing shown assumes that the device was not enabled before entering this sequence. \overline{OE} does not cause Q to be driven until after the rising edge of the following clock.

Timing Waveforms (continued)

Write Timing

- Notes: *1. D(A2) refers to output from address A2. D(A2+1) refers to output from the internal burst address immediately following A2.
- *2. Timing for $\overline{CE2}$ and CE2 is identical to that for \overline{CE} . As shown in the above diagram, when \overline{CE} is LOW, $\overline{CE2}$ is LOW and CE2 is HIGH. When \overline{CE} is HIGH, $\overline{CE2}$ is HIGH and CE2 is LOW.
- *3. \overline{OE} must be HIGH before the input data setup, and held HIGH throughout the data hold period. This prevents input/output data contention for the period prior to the time Byte Write enable inputs are sampled.
- *4. \overline{ADV} must be HIGH to permit a Write to the loaded address.
- *5. Byte Write enables are decided by means of a Write truth table.

Timing Waveforms (continued)

Read/Write Timing
Notes:

- *1. Q(A4) refers to output from address A4. Q(A4+1) refers to output from the internal burst address immediately following A4.
- *2. Timing for $\overline{CE2}$ and CE2 is identical to that for \overline{CE} . As shown in this diagram, when \overline{CE} is LOW, $\overline{CE2}$ is LOW and CE2 is HIGH. When \overline{CE} is HIGH, $\overline{CE2}$ is HIGH and CE2 is LOW.
- *3. Byte Write enables are decided by means of a Write truth table.
- *4. Pass-through occurs when data is first written, then Read in sequence.

AC Test Conditions

Input Pulse Levels	GND to 3V
Input Rise and Fall Times	1.5ns
Input Timing Reference Levels	1.5V
Output Reference Levels	1.5V
Output Load	See Figures 1 and 2
